

Mankind has a few points of reference only. Birth and death are undeniable reference points in mankind's nature. Further points of reference throughout history are: the game for power, money and women. All three can act as an addiction. The actual sustainability of society is exposed best in political decisions. Although rational and legal approaches teach how things apparently work, in practice emotions and feelings play a governing role. More than ever mankind is confronted with political and allegedly legal decisions, often with a predictable expiration date, connected to timely information. Information is inevitably connected to energy in an arbitrary type or form. Energy is the beginning and end of all life and all processes, whatever its origin. Furthermore; each observation is the representation of an underlying concept or event.

We analyse the conditions and driving forces, which determine reliability and sustainability of decisions, the outcomes and the consequences of a decision process. It appears that each process can be expressed in a limited number of distinguishable characteristic critical events, with a connected likelihood of occurrence. One of the most intriguing questions still is: what is the basic driving force of human behaviour? Is it power, money, greed or sex? Clearly sexual behaviour is a built-in driving force by the law of nature. All human behaviour is the parametrized outcome of a process in a three-dimensional energy system, composed of rational, physical and emotional energy. Often emotional energy and rational energy are conflicting energies. No system is sustainable until it has proved to be so.

Any decision can be defined as the parametrized representation of a spiritual feeling in a given dependent time frame, culture and country. Ultimately, nature law will dictate the reliability of the outcome of a process. This implies that absolute truth only exists, in the existence of nature law. The closer a process accomplishes nature law, the greater the reliability and sustainability. The introduced concepts allow an analysis and understanding of any type of process. Using some textual redundancy an attempt has made to clarify observations. The concepts explain today's crisis.
